PROJECT 3 · FINAL PRESENTATION

Fix My Process

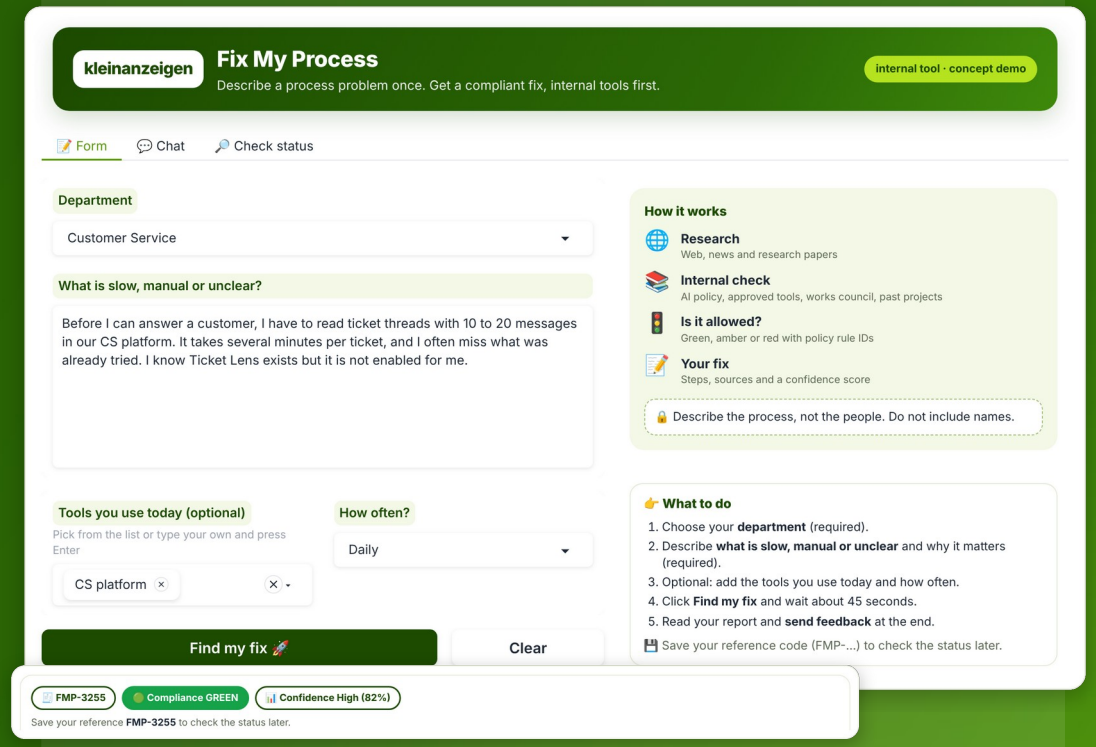

A process problem, described once by Employee

- an approved fix and guide about “How to…” for the employee’

- a checked use case for the AI team and portfolio creation

Personal AI gives you an answer. Fix My Process gives you an approved one.

Ayhan Demir · Built with n8n

Real app UI · result chips from run FMP-3255

Company’s situation, EU AI ACT laws and external tool names are real. Work Council agreement data is typical of a German Betriebsvereinbarung, internal tools and policies are fictional.

Employees fall back on personal AI. Nobody sees why.

PRIMARY USER

Employees

Ops, customer service, finance: everyday process friction

1 Internal tool → 2 Doesn't fit, unclear or no access → 3 Personal AI account → 4 **Strip the data, or take the risk** → 5 Task done

COST Time lost searching, comparing, adapting · Lower-quality results from the wrong tool · Confidential data and compliance exposed

SECOND USER

Tech & AI enablement teams

CPO, internal tool owners

Build internal AI tools without seeing real needs, or why tools are not adopted.

COST Build effort wasted on unused tools · Roadmap built on guesses · No view or control of personal AI use

BY THE NUMBERS

90%+ vs 40%

Companies whose staff use personal AI tools for work, vs companies that bought official LLM tools

MIT NANDA, The GenAI Divide, 2025

~1 in 2

Employees who admit using AI against company policy, e.g. uploading sensitive data to free tools

KPMG & Univ. of Melbourne, 2025

In an AI transformation with tight headcount, the company can't afford tools nobody uses or data risks nobody sees.

Sources: MIT NANDA, "The GenAI Divide: State of AI in Business 2025" · KPMG & University of Melbourne, "Trust, attitudes and use of AI: A global study 2025" (48,000 people, 47 countries)

How it works

One problem in → research, an internal check and a quality gate → two reports out, in about up to 45 seconds

01

Ask

Employee describes the problem once, in a form or chat

- No names
- No login

02

Research

How others solve it: the outside view

- Web
- News
- Papers

03

Check

4 internal knowledge bases, best passages reranked

- Policy
- Tools
- Works council
- Past projects

04

Decide & write

Internal tool first; green, amber or red with rule IDs

- Report A
- Report B

05

Validate

Relevance re-scored, every claim checked against the sources

- Confidence
- Banner < High

06

Deliver

Fix for the employee, card for the AI team, Board for red cases

- App
- Notion
- Slack

TWO READERS, ONE SUBMISSION

Employee: knows what to do today, fix steps, industry insights, a reference code to follow up and a compliance check.

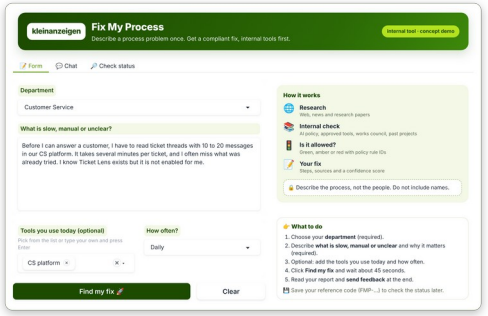

AI team: knows what to build next, sees real needs with, improvement ideas and a Board decision on non-compliant cases.

Every run is logged in Airtable · a hard failure alerts the owner in Slack

See it work

LIVE

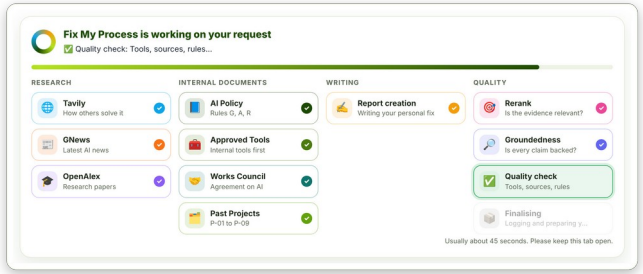

Describe the process, what is slow, manual or unclear? → **Receive a full report with what to do today**

1 Start it

Choose your department and type in your problem.

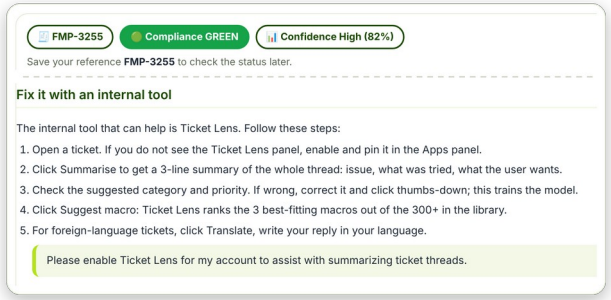

Tools and frequency are optional
App form with the demo input

2 Show it run

3 web sources → 4 internal docs → writing → quality checks

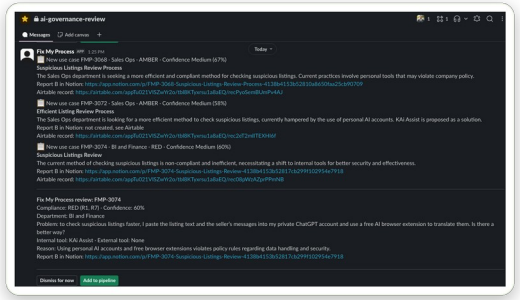

The loader during a run

3 Read the report

Ticket Lens steps, access request, green + rule IDs

Real output FMP-3255, excerpt

4 Prove the log

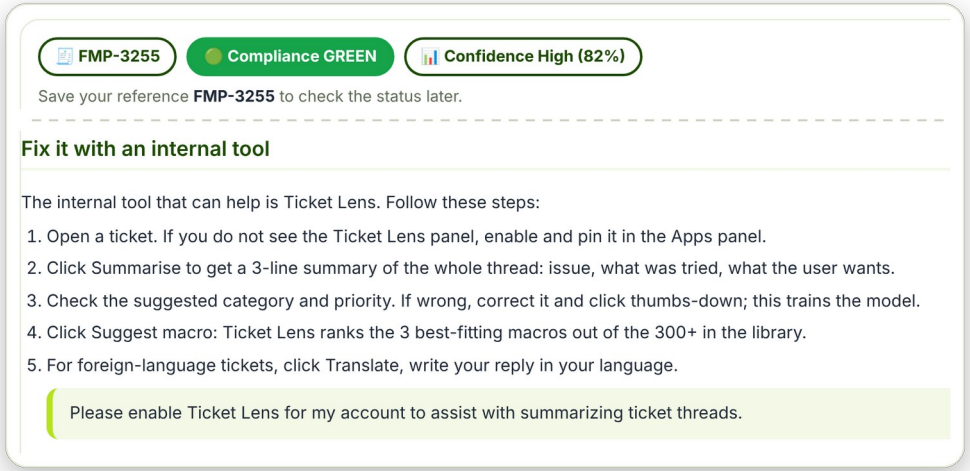

Open a source · Slack notice + Notion card + Airtable table for the AI team

Real Board review, FMP-3074

Backup: Check status FMP-3255 (green) and FMP-3354 (red, waiting for the Board), link in Slack

What each reader gets

EMPLOYEE · REPORT A

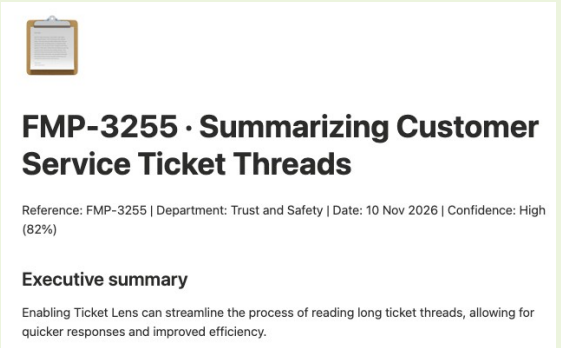

Real output FMP-3255

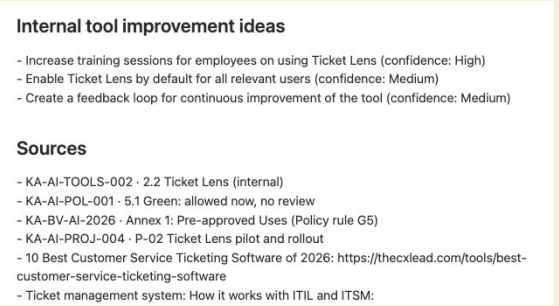

AI TEAM · REPORT B

USE CASE

Summarizing customer service ticket threads

Effort: Medium Impact: High

Same case FMP-3255 · Report B lines, as logged in Notion

~45 s — Instead of a research, compliance and proposal path done by hand, slowly, or not at all

Sources — Internal docs, web, news and papers; every link comes from a real search, not the AI

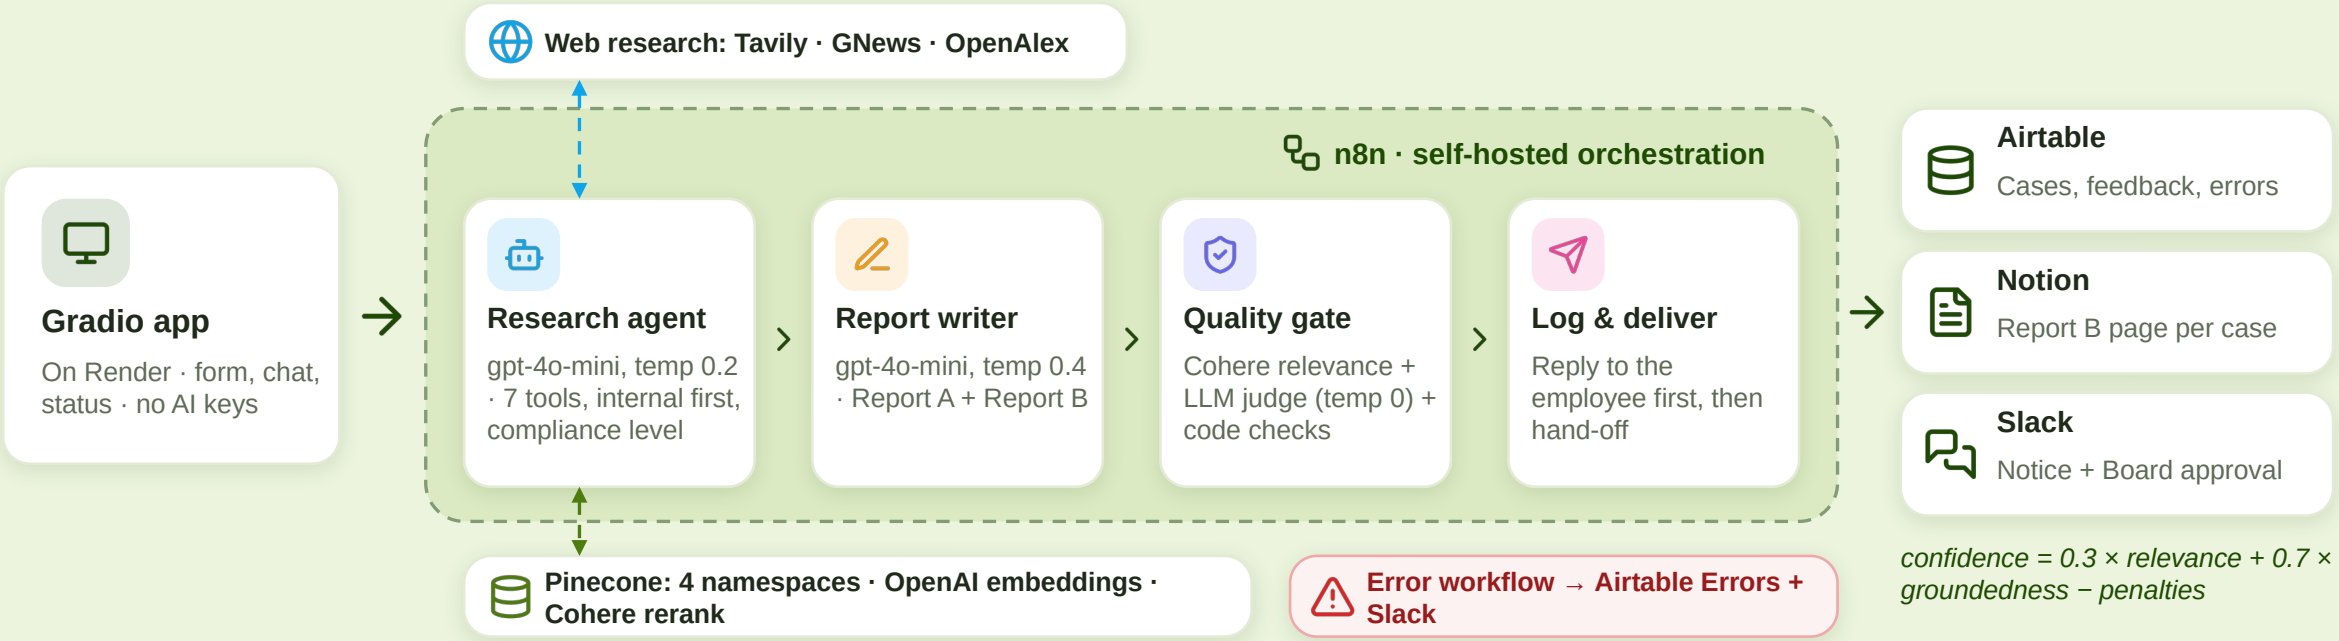

Honest — Confidence label, banner below High; “Not allowed yet” + a safe step for non-compliant cases

PLANNED IN THE SPRINTS

C Portfolio digest · D Adoption & tool gap · E Compliance pipeline · F Ops health

from the same logged data

Under the hood

WHY n8n An ops workflow, not open-ended reasoning. Ready nodes for every system, one canvas reviewers can read. LangGraph only if a step must loop with memory.

$0.021*
per report at list prices
$0.006 on free tiers*

~45 s
per run
16 of 19 study runs ≤ 45 s

25 → 83%
rubric score
after prompt fixes (v1 → v5)

13 / 13
forced failures
caught and logged

What’s next: three go-to-market sprints

1 Close the loop

SPONSOR VALUE

AUDIENCE

CPO / AI enablement team, internal tool owners

CHANNEL

Monthly n8n digest in Slack, reviewed in the AI roadmap meeting

EXECUTION

Turn logged cases and feedback into roadmap input; red cases the Board added get a compliant path via agent usage and n8n with statistical analysis.

WE LEARN

Do employee cases change roadmap and tool decisions? Do adoption rate improve?

SUCCESS METRIC

% of “won’t use” reasons categorised · cases with no internal tool → roadmap items

MILESTONE

First monthly roadmap input from real cases

2 Meet them where they work

USER ACQUISITION

AUDIENCE

Operations employees: 1 or 2 pilot teams chosen with the OEE team

CHANNEL

Slack entry point, introduced in team meetings; KAi Assist champions

EXECUTION

Same workflow behind Slack; PII redaction before any LLM call; reply in thread. Workflow can be mentioned via @ and/or DM.

WE LEARN

Does easier intake grow submissions and internal-tool use? Which intake user choose the most, for intake channel improvements?

SUCCESS METRIC

Submissions per week · internal-tool adoption · feedback rate

MILESTONE

4-week Slack pilot live

3 Smarter and trusted

ORGANISATIONAL ADOPTION

AUDIENCE

Works council, Legal, CPO

CHANNEL

Joint reviews with the works council member of the Board; quarterly review

EXECUTION

Amber and Red case-handling agreement;
Board form with a reason; research loop only if data shows it (langgraph)

WE LEARN

Is the process trusted enough for company-wide rollout? Do research loop improve quality and adoption?

SUCCESS METRIC

% auto-cleared vs reviewed · review turnaround · High reports passing spot checks

MILESTONE

Works council sign-off

Proposed sprints: the metrics are what we will measure, not results yet. Each sprint reuses data the MVP already logs.

Thank you.
